

**SHOES FOR WALKING AND ROLLING**  
**BEST AVAILABLE COPY**

**ABSTRACT**

Shoes with various configurations of rollers secured to one region of their soles for  
5 rolling, while leaving another sole region exposed for walking. The rollers are mounted to  
rotate about an axle defining a primary axis of rotation extending at an angle of between  
about zero and 45 degrees to the walking direction, as viewed from above the shoe, for  
rolling sideways along a support surface. This provides a combined running-rolling method  
of locomotion, by running on the exposed sole surfaces, and then jumping into a "surfing"  
10 stance for rolling. In some cases, the rollers are mounted on steerable truck assemblies. One  
particularly small truck assembly includes wedge-shaped bushings for steering compliance.
